The idea behind this effect is to expand the existing stereo field and to change its boundaries and hence its level of presence. To this end, the plugin has the following parameters: - Stereo field size (in percent). You can adjust this parameter to increase the stereo field or to decrease it. To adjust the value, you can use a mouse, as you would with any slider control. - Stereo expansion ratio (1.0 - 2.0). - Output Stereo Level. This parameter enables you to control the amount of expansion applied to the stereo signal. To set a target output level, you can use the most common slider control, and by entering the target level, you define what volume to apply to the resulting sound. - Output Stereo width. To adjust the stereo width, you can use the most common slider control. The plugin can expand the stereo field in both ways, from the sides or from the top and bottom. To define the direction and the extent of expansion, you can use the two sliders. Stereo expansion is a great tool to add some space to the sound, especially when playing music from speakers located in small rooms or from the back of the speakers. It can create a more realistic sound experience and can even add space to the sound. It's a great way to create stereo effects, and even more effective for small rooms and narrow listening positions.
